## Indirect effect sizes of group on the slope of ESA on the slope of depressive symptoms

The estimates of indirect effect sizes are reported here to allow for comparison with other mediation models, however, these effect sizes are not comparable with commonly used effect sizes.

Indirect effect size	Estimate	95% CI Lower	95% CI Upper
Unstandardised	688	962	487
Partially Standardised	-1.049	-1.35	755
Index of mediation	517	669	373
R2 recommended by MacKinnon (2008)	.182	.109	.262
κ2	.540	.426	.640
Effect Size for two groups	-1.189	245	052

Note: 95% Confidence Intervals reported are bias-corrected and accelerated
